

Get Version

```
npm --version
```

```
//shorthand
```

```
npm -v
```

Create Package.json

```
npm init
```

```
// Below commands will create package.json file with default values
```

```
npm init -y
```

```
npm init --yes
```

@nishasingla05

Install Packages

npm install bootstrap

Global Package

```
npm install -g package-name
```

Production Package(default)

```
npm install --save package-name
```

Development Package

```
npm install --save-dev package-name
```

@nishasingla05

Install Specific Version

npm i bootstrap@16.8.0

Global Package

```
npm install -g package-name@package-version
```

Production Package(default)

```
npm install --save package-name@package-version
```

Development Package

```
npm install --save-dev package-name@package-version
```

@nishasingla05

Remove Packages

npm uninstall bootstrap

Global Package

```
npm uninstall -g package-name
```

Production Package(default)

```
npm uninstall --save package-name
```

Development Package

```
npm uninstall --save-dev package-name
```

@nishasingla05

List packages

Globally

```
npm list -g
```

```
npm list -g --depth 0
```

```
npm list -g --depth 1
```

Locally

```
npm list
```

```
npm list --depth 0
```

```
npm list --depth 1
```

@nishasingla05

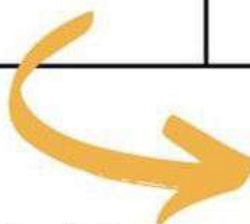

Package version

A version basically has 3 parts

What package version with different symbols (*, ~, ^) represents in package.json file

Version	Meaning
"*"	Install package with latest version
"16.8.0"	Install package with exact version
"~16.8.0"	Install package with latest patch update (Highlighted part gets updated)
"^16.8.0"	Install package with latest minor update (Highlighted part gets updated)

 *most preferred one*

@nishasingla05

NPM Scripts

only "start" script will execute without run command

```
npm start
```

```
npm run <script-name>
```

```
npm run build
```

```
npm run test
```

scripts define in package.json file .

```
"scripts": {  
  "start": "react-scripts start",  
  "build": "react-scripts build",  
  "test": "react-scripts test",  
  "eject": "react-scripts eject"  
},
```

@nishasingla05

Clone another repo

When clone any repo, that time node_modules folder don't get copy on local machine. So in that case to download all packages - use npm i

Install production and dev dependencies both

```
npm install  
or  
npm i
```

Install production dependencies only

```
npm install --production
```
